Score: 4/10

Question 1: What is the primary problem that FINANCELY aims to address in traditional financial advisory services?

- A. Lack of institutional investor support.
- B. Over-reliance on government regulations.
- C. Accessibility barriers, high costs, and fragmented analysis approaches.
- D. Excessive use of automated trading bots.

Explanation: The abstract states that 'Traditional financial advisory services suffer from accessibility barriers, high costs, and fragmented analysis approaches, which disproportionately affect retail investors and financially illiterate users.' FINANCELY aims to solve these issues.

Question 2: Which of the following is NOT one of the machine learning techniques explicitly integrated into FINANCELY for multi-modal analysis?

- A. BERT-based sentiment analysis.
- B. Facebook Prophet time series forecasting.
- C. LSTM for financial time series prediction.
- D. Fundamental analysis via Piotroski Score.

Explanation: The abstract explicitly lists BERT-based sentiment analysis, Facebook Prophet time series forecasting, and fundamental analysis through Piotroski Score as integrated techniques. While LSTMs are mentioned in the literature survey as a related method, they are not listed as an integrated component of FINANCELY itself; Prophet is presented as enhancing over conventional models like ARIMA and LSTM.

Question 3: What is the name of the AI chatbot introduced within the FINANCELY system?

- A. FinBot
- B. Oracle AI
- C. Fibonac
- D. GeminiChat

Explanation: The abstract states: 'A new AI chatbot called "Fibonac" uses Google Gemini for intelligent responses and BERT for query comprehension to offer individualised financial guidance and educational assistance.'

Question 4: On which web framework is the FINANCELY web application implemented?

- A. React.js
- B. Django
- C. Flask
- D. Node.js

Explanation: The abstract mentions: 'Implemented as a Django-based web application, FINANCELY enables portfolio management and multi-dimensional market insights.'

Question 5: What accuracy percentage did the BERT-based sentiment analysis model achieve in FINANCELY?

- A. 15%
- B. 87.3%
- C. 14.9%
- D. 95%

Explanation: The abstract states: 'The experimental results show ... 87.3% accuracy in sentiment analysis (14.9% improvement over lexicon-based methods).'

Question 6: FINANCELY is specifically designed to assist which group of investors?

- A. Institutional and high-net-worth investors only.
- B. Experienced stock market analysts primarily.
- C. Novice, seasoned, uninformed, and rural investors.
- D. Professional fund managers exclusively.

Explanation: The abstract states: 'The system's efficacy in offering precise, real-time financial advice to both novice and seasoned investors is validated on major stocks, such as NVIDIA. This is especially important for uninformed and rural investors who are susceptible to deceptive stock promotions.'

Question 7: According to the text, what is a limitation of conventional time-series prediction models like ARIMA when compared to Facebook Prophet?

- A. They are too computationally expensive.
- B. They often underperform in non-linear, regime-shifting financial contexts.
- C. They cannot handle large datasets.
- D. They lack the ability to provide visual data.

Explanation: The literature survey section states: 'Conversely, ARIMA, while widely adopted for time series modelling [7], often underperforms in non-linear, regime-shifting financial contexts.'

Question 8: Which organization are the authors, Alroy Deon Saldanha and Aniket R T, affiliated with?

- A. Indian Institute of Technology, Bengaluru
- B. R. V. College of Engineering, Bengaluru
- C. Google AI Labs
- D. Facebook Research

Explanation: The author affiliations are clearly listed at the beginning of the paper: 'Department of Artificial Intelligence and Machine Learning, R. V. College of Engineering, Bengaluru, India'.

Question 9: Which of these technical indicators is explicitly mentioned as being used by FINANCELY?

- A. Ichimoku Cloud
- B. Stochastic Oscillator
- C. Relative Strength Index (RSI)
- D. Average True Range (ATR)

Explanation: The abstract lists 'technical analysis using several indicators (Bollinger Bands, MACD, RSI, EMA, SMA, Pivots, OBV)'. RSI is directly included in this list.

Question 10: What is a significant advantage of FinBERT, as highlighted in the literature survey, over traditional dictionary-based approaches like the Loughran–McDonald financial sentiment dictionary?

- A. It requires less computational power.
- B. It provides better data visualization.
- C. It offers more effective extraction of contextual sentiment from financial texts.
- D. It is easier to integrate into web applications.

Explanation: The literature survey states: 'FinBERT, proposed by Araci [3], demonstrated the effectiveness of transformer models in extracting contextual sentiment from financial texts, outperforming traditional dictionary-based approaches such as the Loughran–McDonald financial sentiment dictionary [4].'
